

1.9A Fixed Frequency White LED Driver

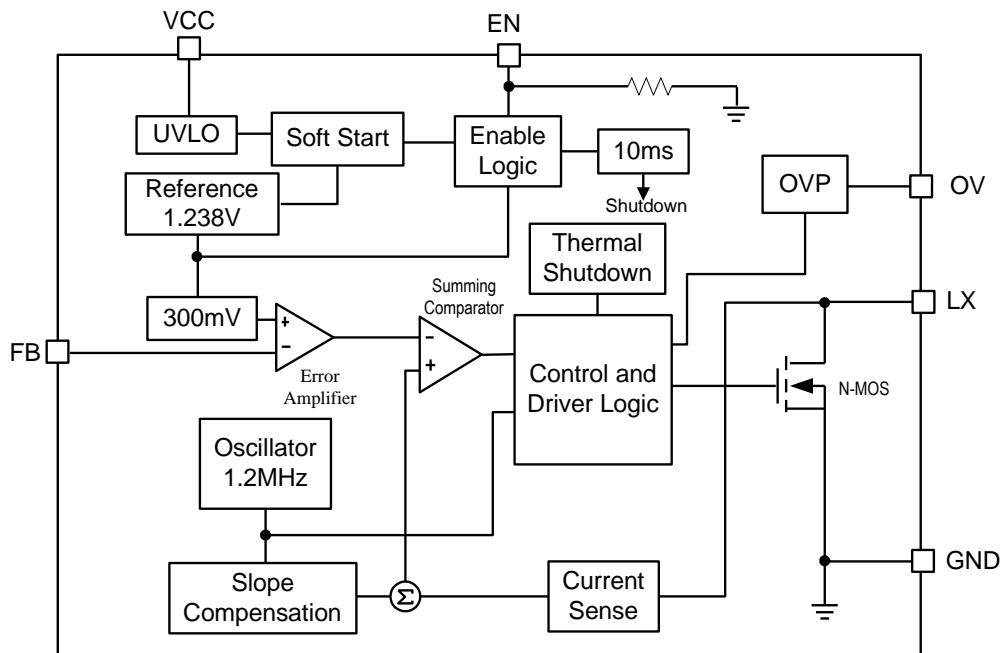

❖ GENERAL DESCRIPTION

The AX2012 is a step-up converter designed for driving up to 8 series white LEDs for backlighting application. The AX2012 uses current mode, 1.2MHz fixed frequency architecture to regulate the LED current, which is set through an external current sense resistor. Its low 300mV feedback voltage reduces power loss and improves efficiency. The OV pin monitors the output voltage and turns off the converter if an over-voltage condition is present due to an open circuit condition. The AX2012 includes under-voltage lockout, current limiting and thermal shutdown protection preventing damage in the event of an output overload. The driver is available in small 6-pin TSOT-23 and 8-pin TDFN (2mm x 2mm) packages.

❖ FEATURES

- 2.5V to 5.5 V operating input voltage range
- Drives up to 8 series White LEDs
- 1.2MHz Fixed Switching Frequency
- Wide range for PWM dimming (200Hz to 200KHz)
- Internal 1.9A switching current limit
- Over Voltage Protection (OVP)
- Internal Soft-start Function
- Current limit and Thermal shutdown protection
- Under voltage Lockout
- Available in the 6-pin TSOT-23 and 8-pin TDFN Packages

❖ APPLICATION CIRCUIT

(1) 8 series LED application

When L1 inductance is greater than 4.7uH please increase C3, R4 and R5 fine-tune output stability.

(2) LED Dimming application

When L1 inductance is greater than 4.7uH please increase C3, R4 and R5 fine-tune output stability.

❖ APPLICATION INFORMATION

Setting the I_{LED} Current

Application circuit item shows the basic application circuit with AX2012 adjustable output version. The external resistor sets the LED output current according to the following equation:

$$I_{LED} = \left(\frac{300mV}{R3} \right)$$

I_{LED}	$R3$	
20mA	15Ω	6mW
350mA	0.857Ω	105mW

Over Voltage Protection

OV measure the output voltage for open circuit protection. Connect OV pin to the output at the top of the LED string. If V_{OUT} above 29V, the OVP protection is happened that stops the internal driver until V_{OUT} below 29V.

Under Voltage Lockout (UVLO)

To avoid mis-operation of the device at low input voltages an under voltage lockout is included that disables the device, if the input voltage falls below (2.25V-100mV).

Input Capacitor Selection

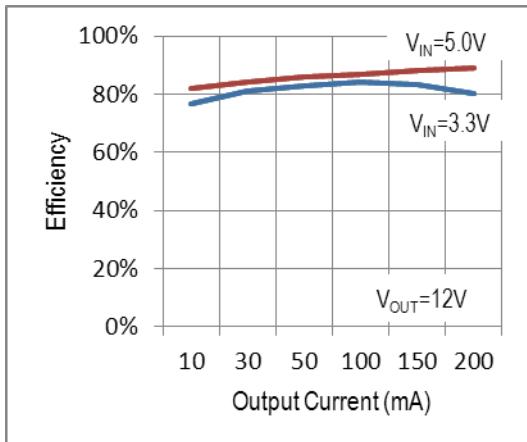

The input capacitor reduces the surge current drawn from the input and switching noise from the device. The input capacitor impedance at the switching frequency shall be less than input source impedance to prevent high frequency switching current passing to the input. A low ESR input capacitor sized for maximum RMS current must be used. Ceramic capacitors with X5R or X7R dielectrics are highly recommended because of their low ESR and small temperature coefficients. A 4.7μF ceramic capacitor for most applications is sufficient. For a lower output power requirement application, this value can be decreased.

Output Capacitor Selection

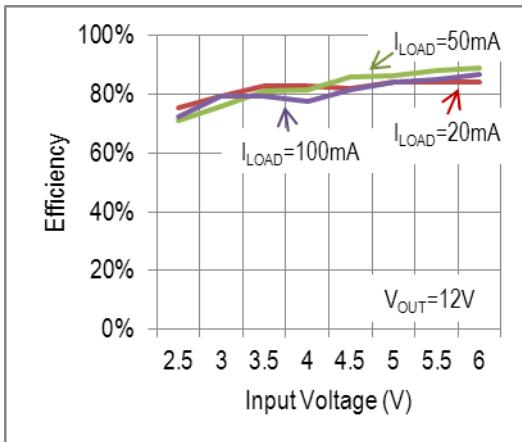

The output capacitor is required to keep the output voltage ripple small and to ensure regulation loop stability. The output capacitor must have low impedance at the switching frequency. Ceramic capacitors with X5R or X7R dielectrics are recommended due to their low ESR and high ripple current. A 1uF ceramic capacitors works for most of the applications. Higher capacitor values can be used to improve the load transient response.
