Description

The [ST3485EB](#), [ST3485EC](#), [ST3485EI](#) and [ST3485EIY](#) devices are ± 15 kV ESD protected, 3.3 V low power transceiver for RS-485 and RS-422 communications. These devices contain one driver and one receiver in half duplex configuration.

These devices transmit and receive at a guaranteed data rate of at least 12 Mbps.

All transmitter outputs and receiver inputs are protected to ± 15 kV IEC 61000-4-2 air discharge.

The driver is short-circuit current limited and is protected against excessive power dissipation by thermal shutdown circuitry that places the driver outputs into a high impedance state.

1 Pin configuration

Figure 1. Pin connections

Table 1. Pin description

Pin n°	Symbol	Name and function
1	RO	Receiver output. If $A > B$ by 200 mV, RO will be high; if $A < B$ by 200 mV, RO will be low.
2	\overline{RE}	Receiver output enable. RO is enabled when \overline{RE} is low; RO is high impedance when \overline{RE} is high. If \overline{RE} is high and DE is low, the device will enter a low power shutdown mode.
3	DE	Driver output enable. The driver outputs are enabled by bringing DE high. They are high impedance when DE is low. If \overline{RE} is high DE is low, the device will enter a low-power shutdown mode. If the driver outputs are enabled, the part functions as line driver, while they are high impedance, it functions as line receivers if \overline{RE} is low.
4	DI	Driver input. A low on DI forces output A low and output B high. Similarly, a high on DI forces output A high and output B low.
5	GND	Ground.
6	A	Non-inverting receiver input and non-inverting driver output.
7	B	Inverting receiver input and inverting driver output.
8	VCC	Supply voltage: $V_{CC} = 3\text{ V to }3.6\text{ V}$.

- ΔV_{OD} and ΔV_{OC} are the changes in V_{OD} and V_{OC} , respectively, when the DI input changes state.
- Measured on $|t_{\text{PLH}}(A) - t_{\text{PHL}}(A)|$ and $|t_{\text{PLH}}(B) - t_{\text{PHL}}(B)|$.
- The transceivers are put into shutdown by bringing $\overline{\text{RE}}$ high and DE low. If the input are in state for less than 80 ns, the part are guaranteed not to enter shutdown. If the inputs are in this state for at least 300 ns, the parts are guaranteed to have entered shutdown.
