MOD-Wii-ICSP-NUNCHUCK

WII NUNCHUCK CONTROLLER WITH ICSP CONNECTOR

WII NUNCHUCK is controller for Wii game console it have 3-axis accelerometer, X-Y Joystick and two buttons. All these features are available through I2C communication, which makes it perfect for connecting throuth UEXT connector. As these controllers are mass produced for the game industry they are at incredible low cost for the features they do offer.

Specially for PIC microcontrollers development boards we make second board WII-ICSP board which takes advantage of ICSP connector which every PIC board have, these are not used after the programming/debugging so make them perfect additional ports which could be used to interface NUNCHUCK without taking additional ports.

Note that to use this board you will also need PIC-ICSP for the ICSP cross-cables as these are not included in WII-ICSP.

FEATURES
WII NUNCHUCK
3 axes accelerometer
XY joystick
two buttons
